Managing auditing licenses	59
Adding license keys	59

About this guide

This document describes how to install and use license management tools provided by Centrify to add, remove, monitor, and generate reports about Centrify licenses and license usage. The license management tools described here include the Centrify Licensing Service, the Licensing Report wizard, and the license management features available in the Access Manager and Audit Manager consoles. The license management tools described here allow you to manage licenses for access control, privilege management, and auditing.

Intended audience

This document is intended for administrators who are responsible for adding, removing, monitoring, and reporting on Centrify licenses. Readers should have administrator privileges to use the Centrify Licensing Service, the Licensing Report wizard, and the Access Manager and Audit Manager consoles.

Conventions used in this guide

The following conventions are used in this guide:

- `Fixed-width font` is used for sample code, program names, program output, file names, and commands that you type at the command line. When *italicized*, the fixed-width font is used to indicate variables. In addition, in command line reference information, square brackets ([]) indicate optional arguments.
- **Bold** text is used to emphasize commands, buttons, or user interface text, and to introduce new terms.
- *Italics* are used for book titles and to emphasize specific words or terms.
- For simplicity, UNIX is used generally in this guide to refer to all supported versions of the UNIX and Linux operating systems unless otherwise noted.

Finding information about Centrify products

Centrify includes extensive documentation targeted for specific audiences, functional roles, or topics of interest. However, most of the information in the documentation set is intended for administrators, application developers, or security architects after you have purchased the software or licensed specific features. If you want to learn more about Centrify and Centrify products and features, start by visiting the [Centrify website](#). From the Centrify website, you can download data sheets and evaluation software, view video demonstrations and technical presentations about Centrify products, and get the latest news about upcoming events and webinars.

Contacting Centrify

You can contact Centrify by visiting our website, www.centrify.com. On the website, you can find information about Centrify office locations worldwide, email and phone numbers for contacting Centrify sales, and links for following Centrify on social media. If you have questions or comments, we look forward to hearing from you.

Getting additional support

If you have a Centrify account, click Support on the Centrify website to log on and access the [Centrify Customer Support Portal](#). From the support portal, you can search knowledge base articles, open and view support cases, connect with other Centrify users on customer forums, and access additional resources—such as online training, how-to videos, and diagnostic tools.

How Centrify licenses are managed

Centrify licenses give you access to the following key Centrify features:

- Secure authentication and identity management
- Role-based access rights
- Delegation of authority
- Auditing of activity

These features can be used together or independently, depending on the type of licenses you purchase and the specific requirements of your organization. For example, licenses for the Standard edition of Centrify Server Suite enable you to install all of the components for identity management, access control, and privilege management. Licenses for Enterprise edition include all of the components of Standard edition, plus components for setting up and managing an auditing infrastructure to capture and store details about user activity for regulatory compliance.

Centrify license management tools

Centrify provides several tools that let you manage Centrify licenses and generate reports about the different types of Centrify licenses you have purchased.

The recommended tool for adding and removing licenses, monitoring license usage, and configuring license usage notification is the *Centrify Licensing Service*. The licensing service works together with Centrify Server Suite components to monitor and report usage and activity for all types of Centrify licenses. For more information about using the licensing service, see [Chapter 3, “Managing licenses with the Licensing Service.”](#)

The recommended tool for generating license reports is the *Centrify Licensing Report wizard*. The wizard generates a report summary and detailed system information about the computers where you have Centrify software deployed. Report information is formatted as

comma-separated values (CSV) in a text file. The report is intended primarily for use by Centrify Support. If requested, you can send it to Centrify Support for analysis. You can also use the report for your own analysis. For more information about the Licensing Report wizard, see [Chapter 4, “Creating licensing reports with the Licensing Report wizard.”](#)

Other Centrify license management and reporting tools are available in the Access Manager and Audit Manager consoles, but are provided only to manage licenses on computers that are not managed by the licensing service. If the licensing service is running in your environment, you should use it, and not Access Manager or Audit Manager, to manage licenses.

The license management tools in Access Manager and Audit Manager are deprecated, and will be removed in a future Server Suite release. For more information about those tools, see [Chapter 5, “Managing licenses with legacy tools.”](#)

How licensing works

Centrify licensing is based on the number of servers and workstations you authorize for access and auditing. License validation and management are handled through the licensing service, the Access Manager console, and the Audit Manager console.

Centrify license management tools check for license keys when any of the following events occur:

- A manual or automatic refresh operation is performed through the licensing service.
- You start the Access Manager console.
- An agent-managed computer joins a zone.
- You start the Audit Manager console, the Audit Analyzer console, or the auditing session player; or when you rotate to a new auditing database using either PowerShell or the SDK.

Checking licenses for access control and privilege management verifies that there are enough license keys installed for all UNIX and Windows computers with valid accounts in Active Directory.

Checking licenses for auditing verifies that there are enough license keys installed for each computer that is connected to an auditing collector.

If the number of licensed computers exceeds the total number of licenses you have purchased, a message is displayed with license usage details, and—if applicable—instructions to add license keys.

After you have installed enough license keys to cover all the configured UNIX, Linux, Mac OS X, or Windows computers, the applicable Centrify console will open at startup and allow you to perform all of the normal administrative tasks.

Understanding license types

Licenses for *access control and privilege management* are purchased and installed separately from licenses for *auditing*. You can use the licensing service to install and manage all types of licenses.

Licenses for access control and privilege management are issued based on how a computer is used. For example, a computer can be licensed as a UNIX or Windows workstation or as a standard UNIX or Windows server, or as an application server. The following types of licenses are available:

- **Workstation Licenses (UNIX or Windows)** permit a specific number of UNIX or Windows workstations to be available to Active Directory users. Workstation licenses are intended for computers that are used interactively by one or two concurrent users but that do not host applications accessed by multiple users. There are separate UNIX workstation and Windows workstation licenses.
- **Server Licenses (UNIX or Windows)** permit a specific number of servers to be available to Active Directory users accessing server-based applications. Server licenses are for computers that are accessed by multiple concurrent users and typically host a specific type of application. There are separate UNIX server and Windows server licenses.

Licenses for auditing are issued for each computer that will be connected to an auditing collector. Auditing licenses are issued separately for UNIX and Windows computers.

Understanding license keys

Depending on whether you have purchased software licenses, your license keys might provide limited *evaluation* usage of the software for a specific number of days, or *permanent* access to features for a specific number of computers. If you initially install using an evaluation license key, you must eventually replace that evaluation key with one or more permanent license keys to continue using the software.

Your capacity for enabling access for standard UNIX services or applications is defined by the total of all of the licenses you purchase and install. For example, if you install three valid license keys that each enable 100 workstations for UNIX access, you have a total of 300 workstation login licenses available.

Each license you purchase has a 24-character registration key that specifies:

- The type of license granted by the key.
- The total number of computers that may be enabled under this key's license. If this is an evaluation key, the number of computers is unlimited, but the license count is displayed as zero (0) to indicate no computers are licensed under the evaluation key.
- The time limit for the key. If the license is a permanent license key, the time limit is not applicable. If the license is an evaluation key, the time is set to a duration that is defined in the license key.

Because each license key specifies a set number of computers, it is common to receive multiple license keys. You can provide these license keys when you install Centrify software on a Windows computer or after installation using the licensing service, the Access Manager console, or the Audit Manager console. For information about using the licensing service to add licenses, see [Chapter 3, "Managing licenses with the Licensing Service."](#) For information about using the Access Manager and Audit Manager consoles to add licenses, see [Chapter 5, "Managing licenses with legacy tools."](#)

How license usage is counted

How license usage is counted depends on these factors:

- Whether the license is for access control and privilege management, or for auditing.
- Whether the licensed computer uses the Windows or UNIX operation system.
- Whether the license is a permanent license or an evaluation license.

Using Centrify licenses in FIPS environments

Each recently issued Centrify license supports both FIPS compliant and non-FIPS compliant environments. The Licensing Service control panel **DC/DZ Deployment** tab and **DA Deployment** tab show the FIPS status of the selected licensing service host computer.

If you install the licensing service on multiple host computers in the forest (for example, for availability and redundancy reasons), it is highly recommended that all hosts have the same FIPS compliance setting. That is, licensing service hosts should all be FIPS compliant, or should all be non-FIPS compliant.

Installing license management tools

In most situations, Centrify license management tools are installed by default when you install Centrify DirectManage Access or DirectManage Audit. However, some license management tools also have standalone installers so that you can perform a manual installation, or modify an existing license management tool installation.

Installing the Centrify Licensing Service

The Centrify Licensing Service is installed by default when you install Centrify DirectManage Access or DirectManage Audit. The default installation location is:

```
C:\Program Files\Centrify\Licensing Service
```

For details about installing Centrify DirectManage Access and DirectManage Audit, see the *Planning and Deployment Guide*.

You can choose not to install the licensing service during DirectManage Access or DirectManage Audit installation by deselecting the **Centrify Licensing Service** check box in the list of components to install when the DirectManage installation wizard executes. For example, if the licensing service is already installed on one computer in the forest and you do not need to install it on other computers, you can deselect it from the list of installed components. However, you should ensure that the licensing service is installed on at least one computer in the forest before deselecting it during DirectManage Access or DirectManage Audit installation.

If you do not install the licensing service when you install DirectManage Access or DirectManage Audit, you can install it separately as described in [Performing a standalone Licensing Service installation](#).

Performing a standalone Licensing Service installation

You can install the Centrify Licensing Service separately from DirectManage Access or DirectManage Audit using the standalone Licensing Service installer.

To perform a standalone installation of the Centrify Licensing Service:

- 1 Log on to the Windows computer and insert the CD or navigate to the directory where you downloaded Centrify files.

If the Getting Started page is not automatically displayed, double click the `autorun.exe` file to start the installation of the Centrify software.
- 2 On the Getting Started page, click **Centrify Licensing Service**.
- 3 At the Welcome page, click **Next**.
- 4 Review the terms of the license agreement, click **I agree to these terms**, then click **Next**.
- 5 Specify a location for installing licensing service components and click **Next**.
- 6 Click **Install** to begin the installation.
- 7 When the installation finishes, click **Finish**.

Note You can also install the licensing service by executing the following installer, which resides in the `Licensing Service` folder in the Centrify Server Suite installation folder:

```
Centrify_Licensing_Service-x.x.x-win64.msi
```

After the licensing service is installed and running, you can use the licensing service control panel to manage Centrify licenses as described in [Chapter 3, “Managing licenses with the Licensing Service.”](#)

Modifying a Centrifys Licensing Service installation

You can change, repair, or remove an existing licensing service installation by executing the standalone Centrifys Licensing Service installer as described in [Performing a standalone Licensing Service installation](#) after the licensing service is already installed.

You can select one of the following options:

- **Change.** Select this option to change installation parameters of the current installation.
- **Repair.** Select this option to remove backup files, re-copy the licensing service program files to the default installation location, and reset registry entries.
- **Remove.** Select this option to remove the licensing service from the computer.

Verifying that the Centrifys Licensing Service is running

To verify that the licensing service is running, open the Services administrative tool on the computer where the licensing service is installed. The “Centrifys Licensing Service” entry should have a status of **Started**.

Installing the Licensing Report wizard

The Licensing Report wizard is installed by default when you install Centrifys DirectManage Access or Centrifys Audit Manager. The default installation location is `C:\Program Files\Centrifys\Deployment Report`.

You can optionally reinstall the wizard manually by executing the Licensing Report wizard standalone installer:

```
Centrify_Licensing_Report-x.x.x-win64.msi
```

The standalone installer is located in the `DirectManage` folder in the Centrify Server Suite installation folder.

Modifying a Licensing Report wizard installation

You can change, repair, or remove an existing Licensing Report wizard installation by executing the standalone installer:

```
Centrify_Licensing_Report-x.x.x-win64.msi
```

The standalone installer is located in the `DirectManage` folder in the Centrify Server Suite installation folder.

You can select one of the following options when you execute the standalone installer in an environment where the wizard is already installed:

- **Change.** Select this option to change installation parameters of the current installation.
- **Repair.** Select this option to remove backup files, re-copy the Licensing Report wizard program files to the default installation location, and reset registry entries.
- **Remove.** Select this option to remove the Licensing Report wizard from the computer.

Managing licenses with the Licensing Service

After the Centrify Licensing Service is installed and running, you can use the Licensing Service control panel to manage Centrify licenses in these ways:

- **Open the Licensing Service control panel.** For more information, see [“Opening the Licensing Service control panel” on page 18.](#)
- **Start and stop the Centrify Licensing Service, and manually refresh license count information.** For more information, see [“Starting, stopping, and refreshing the licensing service” on page 19.](#)
- **Create license containers for Centrify licenses.** For more information, see [“Creating license containers and adding license keys” on page 21.](#)
- **Add and remove licenses for Centrify products.** For more information, see [“Adding and removing Centrify license keys” on page 23.](#)
- **Monitor license usage for each Centrify product.** For more information, see [“Monitoring Centrify license usage” on page 24.](#)
- **Manually refresh license usage information, and configure how often license usage information is refreshed automatically.** For more information, see [“Configuring Licensing Service settings” on page 26.](#)
- **Configure license usage email notification.** You can configure the list of email recipients, the license usage percentage that triggers notification, whether certain environment details should be omitted from email notification, and outbound email sender details. For more information, see [“Configuring license usage email notification” on page 27.](#)
- **View the current licensing service log and configure licensing service logging parameters.** For more information, see [“Configuring and viewing licensing service logs” on page 29.](#)

Opening the Licensing Service control panel

Use the Windows Start menu to open the Licensing Service control panel. If **Centrify Licensing Service Control Panel** is not pinned to the Start menu, use Start menu searching to locate and start the Licensing Service control panel.

The Licensing Service control panel contains the following tabs:

- **General.** Use this tab to monitor current licensing service status, start and stop the licensing service, and manually refresh license count information as described in [“Starting, stopping, and refreshing the licensing service”](#) on page 19.

The Current Configuration area displays the name of the Active Directory forest that the licensing service manages, and the name of the computer where the licensing service is running.

The Monitoring Details area displays the current status of license monitoring, the date of the last license usage update, and license status details. Current status can be one of the following:

- **Idle.** The licensing service is running, and is available to perform a license usage update.
- **Busy.** A license usage update is in progress, or the licensing service is starting.
- **N/A.** The licensing service is not running or is otherwise unavailable.

An additional field, **Service status**, displays whether the Licensing Service is running or stopped.

- **DC/DZ Deployment.** Use this tab to monitor usage details—including license counts—of access control and privilege management licenses. See [“Monitoring Centrify license usage”](#) on page 24 for more information about using this tab.
- **DA Deployment.** Use this tab to monitor usage details—including license counts—of auditing licenses. See [“Monitoring Centrify license usage”](#) on page 24 for more information about using this tab.

- **DC/DZ Licenses.** Use this tab to create license containers, and add or remove licenses for access control and privilege management. See [“Creating license containers and adding license keys” on page 21](#) and [“Adding and removing Centrify license keys” on page 23](#) for more information about using this tab.
- **DA Licenses.** Use this tab to add or remove licenses for auditing. See [“Adding and removing Centrify license keys” on page 23](#) for more information about using this tab.
- **Settings.** Use this tab to configure how often license usage information is automatically refreshed, and license usage email notification details. Email notification details that you can configure include the list of recipients, SMTP server settings, whether some system information is hidden in notification email, and the license usage threshold that triggers email notification. See [“Configuring Licensing Service settings” on page 26](#) and [“Configuring license usage email notification” on page 27](#) for more information about using this tab.
- **Troubleshooting.** Use this tab to manually refresh license usage information and manage licensing service logging. Logging parameters that you can configure include trace level of logged events and log file location. You can also view and save the current log from this tab. For more information, see [“Configuring Licensing Service settings” on page 26](#) and [“Configuring and viewing licensing service logs” on page 29](#).

Starting, stopping, and refreshing the licensing service

Use the **General** tab in the Licensing Service control panel to start, stop, and restart the licensing service, and to refresh license count information manually.

To start and stop the licensing service:

- 1 Open the Licensing Service control panel **General** tab.
- 2 Click **Start**, or **Stop**, or **Restart**.

Whenever you start or restart the licensing service, license usage information is refreshed. See [“Monitoring Centrify license usage” on page 24](#) for information about viewing license usage information.

Licensing service start and stop information can be logged in the licensing log file depending on the log trace level that is configured. See [“Configuring and viewing licensing service logs” on page 29](#) for information about viewing the licensing log and setting the log trace level.

Refreshing the license count manually

In some situations, you might want to refresh the license count information in the licensing service without refreshing all license usage information. When you refresh the license count information as described in this section, license keys are updated in the licensing service, but a complete license usage evaluation is not triggered.

For example, if you add or remove licenses through Access Manager or Audit Manager after the licensing service is installed, you should update the license count in the licensing service as described here so that the license changes that you made through Access Manager or Audit Manager are implemented immediately in the licensing service. If you do not update the license count as described here, license additions or removals that you perform through Access Manager or Audit Manager are not implemented until a regularly scheduled license update task executes.

If you need to refresh all license usage information, including license count, perform the procedure described in [“Refreshing license usage information” on page 26](#).

To refresh the license count manually:

- 1 Open the Licensing Service control panel **General** tab.
- 2 Click **Refresh Now**.

Creating license containers and adding license keys

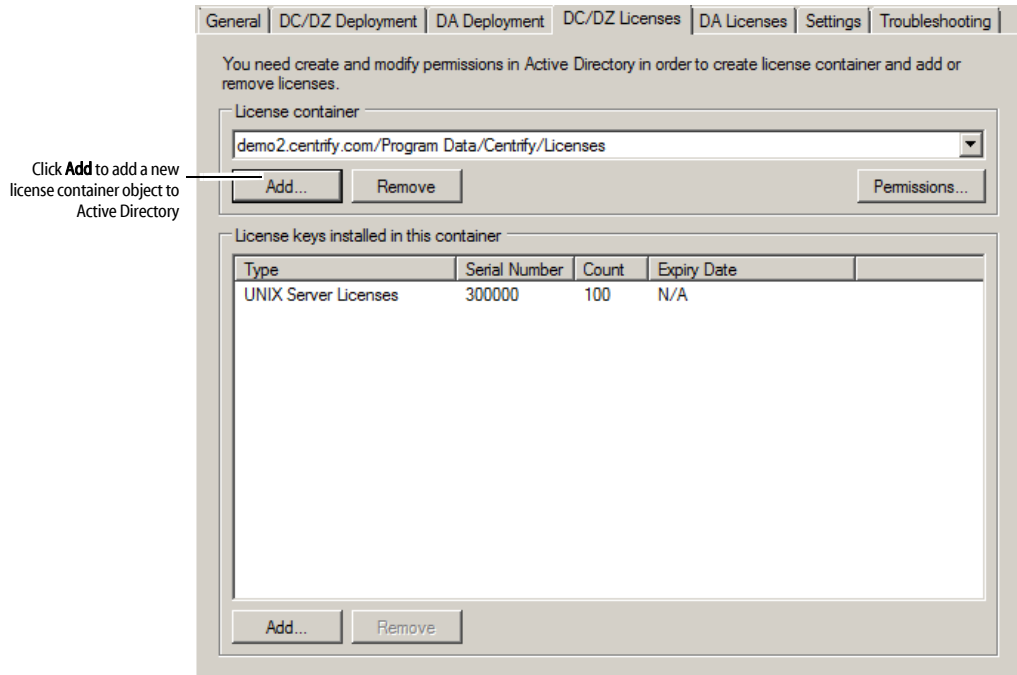

Before you can add Centrify access control and privilege management license keys, you must create a Licenses container object in Active Directory because you must have at least one Licenses container in the forest into which you install license keys. It is also possible to add more License containers to the forest and use those additional containers to control who can use which license keys. For example, you may want to create one license container for application servers and another for workstation licenses. You can then set permissions on the container objects to prevent the workstation administrators from installing the application server license keys and the application server administrators from installing the workstation license keys in their respective containers.

Creating license containers

To add a new license container object for access control and privilege management licenses:

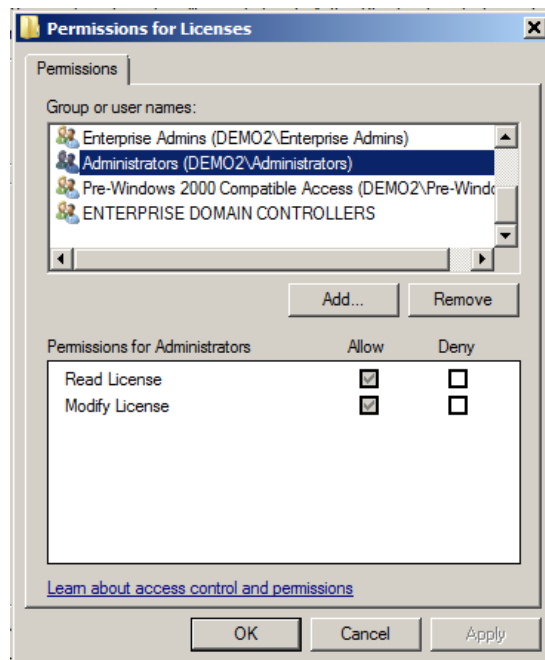

- 1 Open the Licensing Service control panel **DC/DZ Licenses** tab.

2 In the License container section, click **Add**.

- 3 Browse to select a location for the new license container, then click **Create**. Select either container or organizational unit to indicate the type of object to create, and type a name for the new license container object and click **OK**.
- 4 Click **OK** to close the Browse for Container dialog box.
- 5 When prompted to confirm the creation of the container object, click **Yes** to add the license container to Active Directory.
- 6 Click **Permissions** to assign Read License and Modify License permissions to specific users or groups. The users or groups that

you give the Modify License permission to can then add license keys to the new license container.

Adding and removing Centrify license keys

When you install Centrify software for access control and privilege management, you must provide at least one licensing key that is specific to access control and privilege management. Likewise, when you install auditing, you must provide at least one license key that is specific to auditing.

Note If you are using a valid evaluation license key for auditing and install a permanent auditing license key, the evaluation key is automatically removed from the auditing installation. If you are using a valid permanent auditing license key and install an evaluation license key for auditing, the evaluation key takes precedence as long as it has not expired.

To add license keys for access control and privilege management:

- 1 Open the Licensing Service control panel **DC/DZ Licenses** tab.
- 2 In the **License container** section, select the appropriate License container from the list of available license containers.

- 3 At the bottom of the dialog box, in the **License keys installed in this container** section, click **Add**.
- 4 Type or paste the new license key string, then click **OK**.
- 5 Click **OK**.

To add license keys for auditing:

- 1 Open the Licensing Service control panel **DA Licenses** tab.
- 2 In the **Installation** section, select the auditing installation for which you are adding a license.
- 3 Click **Add**.
- 4 Type or paste the new license key string, then click **OK**.
- 5 Click **OK**.

To delete a license key that you have previously installed:

- 1 Open the Licensing Service control panel **DC/DZ Licenses** tab or the **DA Licenses** tab.
- 2 In the **License keys installed in this container** section, highlight the license to delete, click **Remove**, and then click **OK**.

Monitoring Centrify license usage

The Licensing Service control panel allows you to monitor how many Centrify licenses in the forest are in use, and how many are available. You can see usage information for access control and privilege management licenses, and for auditing licenses.

Note To generate a more comprehensive report of license usage, including detailed system information about the computers where you have Centrify software deployed, use the Licensing Report wizard. When you generate a license usage report with the wizard, information is formatted as comma-separated values (CSV) in a text file. See [Chapter 4, “Creating licensing reports with the Licensing Report wizard”](#) for more information.

To see usage information for access control and privilege management licenses:

- 1 Open the Licensing Service control panel **DC/DZ Deployment** tab.

The license usage information that is displayed when you first open the tab is from the last time you refreshed the information in the **DC/DZ Deployment** dialog box. If you restarted the Licensing Service or refreshed license usage information from the **Troubleshooting** tab, the latest license usage information is not displayed in the **DC/DZ Deployment** dialog box until you perform [Step 2](#) and [Step 3](#).

- 2 In the **Source** field, select the licensing service host computer for which to report license usage information.

If you select **Last Updated Centrify Licensing Service**, the licensing service host computer containing the latest valid licensing information is selected.

- 3 Click **Refresh**.

Information displayed in the dialog box is based on the most recent refreshing of license usage information, which is generated by a scheduled refresh, manual refresh, or starting the Licensing Service. That is, clicking **Refresh** here does not instruct the licensing service to check current license usage.

- 4 Optional: To display current license usage information:
 - a Perform a manual refresh from the **Troubleshooting** tab as described in [“Configuring Licensing Service settings”](#) on page 26.
 - b Return to the **DC/DZ Deployment** tab and click **Refresh**.

To see usage information for auditing licenses:

- 1 Open the Licensing Service control panel **DA Deployment** tab.

The license usage information that is displayed is for all available auditing installations (that is, global capacity and usage are shown).

- 2 In the **Source** field, select the licensing service host computer for which to report license usage information.

If you select **Last Updated Centrify Licensing Service**, the licensing service host computer containing the latest valid licensing information is selected.

- 3 In the **Installation** field, select an auditing installation whose licensing information you want to see.
- 4 Click **Refresh**.

Information displayed in the dialog box is based on the most recent refreshing of license usage information, which is generated by a scheduled refresh, manual refresh, or starting the licensing service. That is, clicking **Refresh** here does not instruct the licensing service to check current license usage.

- 5 Optional: To display current license usage information:
 - a Perform a manual refresh from the **Troubleshooting** tab as described in [Configuring Licensing Service settings](#).
 - b Return to the **DA Deployment** tab and click **Refresh**.

Configuring Licensing Service settings

Use the **Settings** tab in the Licensing Service control panel to refresh license usage information and configure licensing email notification details.

Refreshing license usage information

You can use the licensing service to refresh license usage information in these ways:

- Start or restart the licensing service as described in [“Starting, stopping, and refreshing the licensing service”](#) on page 19.
- Configure an automatic refresh interval as described in this section.
- Perform a manual refresh of license count and usage as described in this section.

To configure an automatic refresh interval:

- 1 Open the Licensing Service control panel **Settings** tab.
- 2 In the Update Schedule section, click **Configure**.
- 3 Specify a start time and recurrence pattern (interval), and click **OK**.

To manually refresh license count and usage information:

- 1 Open the Licensing Service control panel **Troubleshooting** tab.
- 2 Click **Refresh Now**.

Note Manually refreshing license count and usage as described here updates both license count and license usage. If you want to update just the license count (for example, due to performance considerations), perform the procedure described in “[Refreshing the license count manually](#)” on page 20.

Configuring license usage email notification

Email is sent to a list of recipients when a license is deployed. Routine notices are sent if license usage is below 90% (or a different threshold if you specify one). Warnings are sent if usage thresholds are exceeded. The default thresholds that trigger email warnings are 90%, 100%, and 120%.

Typical email notification appears as follows, and includes an attachment of the latest report generated by the Licensing Report wizard (not shown here):

```
From: "Centrify Licensing Service" <licensing@domain.com>
To: "System Administrator" <sysadmin@domain.com>
Subject: Notice from Centrify: You are deploying 17% of your
DirectControl/DirectAuthorize UNIX licenses, 20% of your
DirectAuthorize Windows licenses, and 30% of your total DirectAudit
licenses.
Date: Monday, October 31, 2016 12:00 AM
DirectControl/DirectAuthorize UNIX usage: 13 out of 75
DirectAuthorize Windows usage: 5 out of 25
Total DirectAudit usage: 15 out of 50
```

```
=== DirectControl/DirectAuthorize Usage Summary ===
UNIX Server: 5 used, 50 licensed
UNIX Workstation: 5 used, 25 licensed
UNIX without license type: 3 used
Windows Server: 2 used, 25 licensed
Windows Workstation: 3 used, 0 licensed
DirectControl/DirectAuthorize Evaluation: 0 licensed
DirectControl UNIX - Express: 0 used
Mac systems: 0 used
zLinux systems: 0 used

=== DirectAudit Usage Summary ===
UNIX Server: 5 used, 25 licensed
UNIX Workstation: 5 used, 0 licensed
UNIX without license type: 0 used
Windows Server: 2 used, 25 licensed
Windows Workstation: 3 used, 0 licensed
DirectAudit Evaluation: 0 licensed
zLinux systems: 0 used
```

You can configure email notification details such as the list of recipients, SMTP server settings, whether to omit some system information from the report attached to the notification email, and one license usage threshold that replaces the default 90% threshold.

To configure license usage email notification:

- 1 Open the Licensing Service control panel **Settings** tab.
- 2 In the Notification section, click **Configure**.
- 3 To add or remove a user on the email recipient list:
 - To remove the user from the list of recipients, highlight the user name and click **Remove**.
 - To add a user to the list of recipients, click **Add** in the Recipients section. Type the email address and display name for the user and click **OK**.
- 4 To configure SMTP server settings:
 - Type the display name and email address of the user who is the email sender.
 - Type the host name or IP address of the outbound email server and specify a port number.

- If the outbound email server requires secured password authentication for login, select **This server requires authentication** and type the name and password of a user with login permission. If the outbound email server does not require secured password authentication for login, leave this check box unchecked.
 - To optionally test the SMTP configuration, click **Test** and specify a recipient for the test email message.
- 5 To specify that a warning is sent when license usage exceeds a threshold other than 90%, select **Warn when the usage reached** and specify a threshold value from 1% to 89%. The threshold that you specify is used instead of the default 90% threshold.
 - 6 The license usage report generated by the Licensing Report wizard is included as an attachment in email notification. To omit host, zone, and installation names from the attachment, select **Hide host, zone and installation names from the attached licensing report**.
 - 7 Click **OK**.

Note Depending on how a recipient's email filters are configured, notification email might be redirected to a recipient's junk or spam folder. If a recipient is not receiving email as expected, check the recipient's junk or spam folder. If necessary, modify the recipient's email filters so that notification email is not directed to the junk or spam folder.

Configuring and viewing licensing service logs

Detailed licensing service log files are created while the licensing service is running, and are saved in the following default location:

```
C:\Program Files\Common Files\Centrify Shared\Logs
```

In addition to viewing the current log file, you can edit the current file, configure which events are stored in log files (that is, the logging level) and specify the location where log files are stored.

To view and edit the current log file:

- 1 Open the Licensing Service control panel **Troubleshooting** tab.
- 2 To save the current log file without first opening it for viewing, click **Save As**, navigate to a folder location, specify a name for the log file, and click **Save**.
- 3 To open the log file for viewing and editing, click **View Log**. While the file is open for viewing, use the **File** and **Edit** menus to save the file to a name and location of your choice, select parts of the file for copying, or clear the file.
- 4 To save a zipped version of the log file to a location of your choice, click **Export Diagnostics Data**, specify a folder location, and click **OK**.

To configure licensing service event logging level:

- 1 Open the Licensing Service control panel **Troubleshooting** tab.
- 2 Click **Options**.
- 3 In the Log Settings dialog box, select one of the following categories of events to log:
 - No log messages
 - Error messages
 - Warning messages
 - Informational messages
 - All messages
- 4 Click **Apply**, then click **OK**.

To specify a different licensing service log file folder:

- 1 Open the Licensing Service control panel **Troubleshooting** tab.
- 2 Click **Options**.
- 3 In the **Log folder path** field, specify or browse to the folder where you want to store licensing service log files.
- 4 Click **OK**.

Creating licensing reports with the Licensing Report wizard

The Licensing Report wizard collects information about the Centrify software you have deployed, including how many licenses you have installed, where they are used, where they are inactive, and the number of licenses that remain available in the forest. Information is reported for access control, privilege management, and auditing licenses.

The wizard is installed by default when you install Centrify Server Suite on a Windows computer. You can also download and install the wizard separately using a standalone setup program as described in [“Installing the Licensing Report wizard” on page 15](#).

You can start the wizard directly from within Access Manager or independently from the Start menu as described in [“Running the Licensing Report wizard” on page 34](#).

Permissions required to generate a licensing report

You must have the following privileges to generate a licensing report:

For this edition of Centrify software	You must have
Centrify Express for UNIX/Linux	A user account in a domain that is trusted by other domains in the forest, or an account that can search and read information from all of the domains in the forest.
Standard Edition	A user account in a domain that is trusted by other domains in the forest, or an account that can search and read information from all of the domains in the forest.
Enterprise Edition	A user account with the permissions required for Standard Edition plus the “Manage License” or “View” permission for the audit installation.

You can specify different user accounts when you run the wizard, if needed. For example, you might need to use different accounts to collect information about one or more audit installations.

Information required to produce the licensing report

Before you run the wizard, you should verify you have the following information available:

What you need	Here's why
Folder location	<p>The Licensing Report wizard can be installed with Centrify Server Suite or downloaded and installed as a separate executable file.</p> <p>If you download the file from the Centrify website, it is saved by default in your Downloads folder. This folder is usually located on the drive where Windows is installed in a folder with your user name. For example, the path to the file might be similar to this:</p> <p>C:\Users\your_name\Downloads</p>
Domain controller	<p>Centrify products are licensed for the whole forest. Therefore, the wizard must be able to connect to a domain controller that can access Active Directory information for the entire forest.</p> <p>You are prompted to specify the domain controller and credentials for connecting to the domain when you start the wizard. Alternatively, you can specify the name of a domain that is trusted to access other domains in the forest.</p>
User credentials for DirectControl/ DirectAuthorize	<p>The wizard must be able to read license and deployment information from the domain controller that has access to all domains in the forest. By default, your logon account credentials are used to connect to the domain controller.</p> <p>If your logon account does not have the List Objects permission to access the domain controller, you can specify a different user name and password when prompted to specify the account credentials for connecting to the domain.</p>

What you need	Here's why
User credentials for DirectAudit	<p>The licensing report wizard attempts to retrieve usage information from Active Directory before attempting to retrieve information from audit store databases. The wizard attempts to connect to audit store databases only if the information is not found in Active Directory. If the wizard needs to connect to an audit store database, user credentials and the "Manage License" or "View" permission for each installation are required.</p> <p>By default, the same user credentials are used to get all deployment information. However, if the user account does not have the "Manage License" or "View" permission, you can specify a different user name and password for audit installations when prompted.</p>
Report output configuration	<p>You need to specify the file name and folder location for the licensing report generated by the wizard.</p> <p>You must also decide whether the report output should show or hide information about the computers where you have deployed Centrify software. If you choose to hide zone, computer, and installation names, the information will be replaced with a one-way hash of the text to prevent the computers from being identified in the report. If you choose this option, you will not be able to review and validate license information for specific computers.</p> <p>The report output is saved as comma-separated values (CSV) in a text file.</p>

Preparing to run the Licensing Report wizard

To keep the report output concise, Centrify recommends that you check for and remove orphaned computer accounts and decommissioned computers before generating a licensing report.

To check for and remove orphaned and decommissioned computers:

- 1 Open Active Directory Users and Computers and delete the computer objects associated with the decommissioned computers.
- 2 Open Access Manager.

- 3 Select DirectManage Access Manager, right-click, then select **Analyze**.
- 4 Select **Orphan zone data objects and invalid data links**, then click **Next**.
- 5 Click **Finish**.
- 6 Select Analysis Results to check whether any orphan information was found.

If there are deleted computer objects with an orphan zone profile listed in the Analysis Results, select the issue, right-click, then select **Remove orphan profile**.

Running the Licensing Report wizard

After you have installed the Licensing Report wizard as part of Centrify Server Suite or as a separate standalone installation package, you can run the wizard to generate a licensing report. You can start the wizard from within Access Manager or by navigating to it from the Start menu.

To run the wizard from within Access Manager:

- 1 Open Access Manager.
- 2 Select DirectManage Access Manager, right-click, then select either **Centrify Licensing Report (Standard Edition)** or **Centrify Licensing Report (Enterprise Edition)**.

If you select Standard Edition, the licensing report utility automatically checks the current forest for DirectControl and DirectAuthorize information using your current account credentials. If you need to specify different credentials or check DirectAudit licenses, select **Centrify Licensing Report (Enterprise Edition)** or from the Start menu select **Centrify Licensing Report**.

- 3 Click **Next** to accept the default domain controller and your current credentials to retrieve deployment information.

If necessary, you can specify a different domain controller and select the option to specify a different user if your current account

does not have permissions to retrieve deployment information, then click **Next**.

- 4 If the Audit Management service is not running, or if DirectManage Audit version 2015.1 or earlier is installed, or if you do not have the necessary audit permissions, you are prompted to specify credentials to retrieve audit installation information.

If you see this prompt, click **Next** to use your current credentials to retrieve audit installation information.

If necessary, you can select the option to specify a different user, then specify a different user name and password if your current account does not have the “Manage Licenses” or “View” permission for the audit installation, then click **Next**.

If you do not see this prompt, go to **Step 6** and continue from there.

- 5 If the Audit Management service is not running, or if DirectManage Audit version 2015.1 or earlier is installed, or if you do not have the necessary audit permissions, you are prompted to specify whether your current credentials can be used to retrieve audit installation information.

If you see this prompt, click **Next** if the credentials specified in **Step 4** can retrieve information for all of the audit installations listed.

If necessary, you can select an audit installation and click **Change Credentials** to specify a different user name and password for connecting to a specific installation, then click **Next**.

If you do not see this prompt, go to **Step 6** and continue from there.

- 6 Specify the name and folder location for the licensing report and whether to hide host, zone, and installation names in the report output, then click **Next**.
 - By default, the licensing report output is located in your Documents folder with a name in the format of `Centrify_Licensing_Report_yyyymmdd.txt`, where `yyyymmdd` is the year, month, and date indicating when you are generating the report. If a report of the same name already exists in that location, a version number suffix is added to the default report name.

- Select the option to **Hide host, zone, and installation names from the report** to keep this information private. The wizard will generate random strings to replace host, zone, and installation names in the report output. Note that selecting this option does not obfuscate the Active Directory forest name. The forest name is required to send the report output to Centrify. All other names included in the report can be replaced with random strings.
- 7 Review the output location and file name, then click **Next** to generate the report.
 - 8 To preview the report before saving it or sending it to Centrify, click **Preview Report**.

To open the report for editing or to save it as a different file name, leave the **Open the output report** option selected and click **Exit**.

To send the report output directly to the Centrify Support portal, click **Send to Centrify**.
 - 9 Click **OK** to acknowledge that the report will be sent and continue.

You will be given a reference number for communicating with support about the report and prompted to log in using your Centrify account user name and password. After logging in, click **Continue** to display details about your report.

Running the utility as a separate package

You can access the shortcut for the licensing report executable directly from the Start menu. If **Centrify Licensing Report** is not pinned to the Start menu, use Start menu searching to locate and start the licensing report utility. After you open the utility, the steps for generating the report are the same as the steps in the previous section. Follow the instructions in the wizard to generate the report output.

Running the utility from the command line.

As an alternative to running the licensing report utility as a wizard, you can use the command-line interface to run the wizard in a Command Prompt window. To use the command-line interface for the utility, navigate to the directory where the

CentrifyDeploymentReport.exe file is located (the default location is C:\Program Files\Centrify\Deployment Report). Open a Command Prompt window, and execute the command using the following syntax:

```
CentrifyDeploymentReport.exe [/standardmode]
[/server=server] [/plaindata] [/silent /output=filepath]
[/force]] [/help] [/?]
```

You can use the following options with the utility:

Use this option	To do this
/standardmode	Run CentrifyDeploymentReport.exe with standard edition support only.
/server= <i>server</i>	Specify the name of a domain controller in the forest for which you want to run the report.
/plaindata	Include host, zone, and installation names in the report. By default, host, zone, and installation names are not included in the report.
/silent	Run CentrifyDeploymentReport.exe in silent mode. You can use this option when generating the report for Centrify Server Suite Standard Edition using the /standardmode option, or without the /standardmode option to generate an Enterprise Edition report.
/output= <i>filepath</i>	Specify output file path and file name of the licensing report. You can use this option only when you are using the /silent option.
/force	Force the generation of a new licensing report even if the output file specified already exists. You can use this option only when you are using the /silent option.
/help, /?	Display command syntax and usage information.

Reviewing the licensing report output

The Licensing Report wizard generates a report formatted as a set of comma-separated values (CSV) in a text file. The report contains two main sections:

- The first section contains summary information about the counted computers where you have Centrify software deployed.

- The second section contains detailed information about the computers where you have Centrify software deployed, including separate areas for counted and uncounted computers. If a computer is uncounted, a comment explains the reason why it is uncounted.

Note See “How computers are counted for licensing reports” on page 39 for more information about which computers in the forest are counted, and how their licenses count against the total number of available licenses.

The first and second report sections are separated from each other as follows:

Section 1: Summary information about counted computers

```
==== END OF REPORT SUMMARY. DO NOT MODIFY ANYTHING ABOVE THIS LINE =====
```

Section 2: Detailed information about counted and uncounted computers

Just before the end of Section 1, a checksum is included to validate the authenticity of the report. For example:

```
Checksum, 1, "frACfH0SRjhEDxPFU5ZAbfoZ5ISMKm1ZFqssWG79V4Wr  
3QC4Fp1wneQG03U26C+1U0608J5PdrV2vuH0nMJLxcdi6cV4nerrZPhm  
h1If7MU="
```

Editing the checksum or any other part of Section 1 invalidates the report. If you make any changes in this section, you will need to generate a new report.

You should also note that the last lines in the report are a report identifier string and the version number of the Licensing Report wizard that generated the report. For example, you might see lines similar to this at the end of the report:

```
Report ID, "8OY5i6p0LZtePMYTAg0PqcImIZA="
Version, "5.4.0.118"
```

You should not modify or delete the report identifier or the version number.

How computers are counted for licensing reports

To generate a report, the licensing report software first determines which computers in the forest are validly using Centrify software. These “valid usage” computers are considered “counted” computers. Licenses for counted computers are subtracted from the total number of available permanent workstation or server licenses, and their licensing summary information is reported in Section 1 of the licensing report.

Counted computer scenarios

A computer is counted if the following scenarios are true:

- The computer’s zone status is **Auto Zone** or **Zoned**. This scenario applies only to computers where access control and privilege management features are installed.
- The computer has a status of **Active**.

Uncounted computer scenarios

Uncounted computers are included (together with counted computers) in Section 2 of the licensing report, but are not shown in Section 1 because their licenses are not subtracted from the total number of available licenses.

A computer is uncounted if any one of the following scenarios is true:

- The computer’s zone status is **Express** or **Unmanaged**. This scenario applies only to computers where access control and privilege management features are installed.
- The computer is using an access control and privilege management license, and is joined to the **Null Zone**. Note that computers using auditing licenses are counted even if they are joined to the null zone.
- The computer has a status of **Inactive**.
- The computer is using an access control and privilege management license, and is **Orphaned** (the computer profile exists in the zone but the corresponding Active Directory computer

object has been removed). Note that computers using auditing licenses are counted even if they are orphaned.

- The computer has a **Duplicated** auditing license (the auditing agent was migrated from one installation to another, and the time stamp of the agent from the earlier installation has not expired).
- The computer has an **Unknown logon time** (the computer has never joined the domain).

License type information for managed and audited computers

If you have access control and privilege management features or auditing features deployed, the summary in report Section 1 includes information about the type of Centrify license in use on each computer.

License type can be one of the following values:

- **Server**
- **Workstation**
- **None** (The license type cannot be determined from the Active Directory object, as is the case when the computer is orphaned, or the agent is from a Server Suite release earlier than 2015.1.)

See [“Understanding license types” on page 10](#) for more information about license types.

Zone information for managed computers

If you have access control and privilege management features deployed, report Section 1 includes zone mode information in the “DirectControl/DirectAuthorize Agent Type” string shown in [“Example 2: Zone mode and number of agents” on page 48](#).

Note Zone mode applies only to computers where access control and privilege management features are installed. Zone mode does not apply to computers using auditing licenses.

Depending on the nature of your deployment, the zone mode information displays one of the following values:

- **Auto Zone** if the computer is in a Centrify Auto Zone.
You cannot use Centrify rights and roles on computers joined to an Auto Zone.
If the Zone mode for a computer is Auto Zone, the computer is included in the DirectControl license count.
- **Zoned** if the computer is in a standard Centrify zone.
All access control and privilege management features are supported for computers in Centrify zones on most platforms. However, the Centrify agent for Mac OS does not support Centrify rights and roles.
If the Zone mode for a computer is Zoned, the computer is included in the DirectControl license count.
- **Express** if the computer has a Centrify Express agent installed.
Computers with a Centrify Express agent have limited functionality. For example, you cannot apply group policies or use Centrify rights and roles on computers with the Centrify Express agent.
If the Zone mode for a computer is Express, the computer is not included in the DirectControl license count.
- **Unmanaged** if a computer has the Centrify agent installed but is not connected to a zone.
This agent type is primarily for computers that use Centrify MFA for Windows login authentication.
If the Zone mode for a computer is Unmanaged, the computer is not included in the DirectControl license count.
- **Null Zone** if a computer is joined to the null zone.
If the Zone mode for a computer is Null Zone, the computer is not included in the DirectControl license count.

See [“Example 2: Zone mode and number of agents” on page 48](#) for details about how zone mode information is displayed in the report.

Status information for managed and audited computers

If you have access control and privilege management features or auditing features deployed, the counted/uncounted information in report Section 2 indicates the status of the computer as **Active** or **Inactive**:

- **Active** if the computer has been used for access control and privilege management, or for auditing, within 45 days prior to the date that the report was run.

Computers with an active status are included in the license count.

For access control and privilege management licenses, the time stamp of the managed computer logon to the domain controller is monitored if the functional level of the domain controller is Windows Server 2003 or later. The licensing report uses the time stamp of the `LastLogonTimeInterval` attribute to determine whether there has been logon activity within 45 days prior to the date that the report was run.

For auditing licenses, the licensing report uses the most recent time that the managed computer has communicated with a collector to determine whether there has been auditing activity within 45 days prior to the date that the report was run.

- **Inactive** if the computer has not been used for access control and privilege management, or for auditing, within 45 days prior to the date that the report was run.

Inactive computers are not included in the license count.

See [“Example 6: Counted DirectControl and DirectAuthorize computers” on page 51](#) for an example of computer status information.

Remarks for managed and audited computers

If you have access control and privilege management features or auditing features deployed, the counted/uncounted information in report Section 2 includes remarks about the following computers:

- Uncounted computers with access control and privilege management licenses.
- Counted and uncounted computers with auditing licenses.

Remarks provide additional information about why a computer is uncounted, and other significant information to be aware of. See [“Example 7: Counted DirectAudit computers” on page 52](#) and [“Example 8: Uncounted computers for all license types” on page 54](#) for examples of remarks strings.

The Remarks string can have the following values:

- **Duplicated** if an auditing agent was migrated from one installation to another (such as during an upgrade), and the time stamp of the agent from the earlier installation has not expired.

Computers with duplicated licenses are not counted. That is, the license is only counted once.

- **Excluded due to null zone** if the computer was not counted because it is joined to the null zone.

Computers with access control and privilege management features (DirectControl and DirectAuthorize licenses) are not counted if they are joined to the null zone.

Computers with auditing features (DirectAudit licenses) are included in the auditing license count even if they are joined to the null zone.

- **Excluded due to unmanaged mode** if the computer has a zone mode of Unmanaged (that is, the computer has the Centrify agent installed but is not connected to a zone).
- **Excluded due to express mode** if the computer has a Centrify Express agent installed.

- **Inactive** if the computer has a status of Inactive as described in “[Status information for managed and audited computers](#)” on [page 42](#).
- **None** if no additional information is required.
- **Orphaned** if the computer profile exists in the zone but the corresponding Active Directory computer object has been removed.

Orphaned computers with access control and privilege management features (DirectControl and DirectAuthorize licenses) are not included in the license count. You can use Access Manager to delete orphan profiles as described in “[Preparing to run the Licensing Report wizard](#)” on [page 33](#).

Orphaned computers with auditing features (DirectAudit licenses) are included in the auditing license count if the computer has communicated with a collector within 45 days prior to the date that the report was run.

- **Unknown logon time** if the computer has never joined the domain. This situation typically occurs when you use Access Manager to prepare a UNIX computer prior to joining the computer to the domain. Computers with an unknown logon time are not included in the license count.

Evaluation licenses for managed and audited computers

If a computer has a valid evaluation license, the detailed section of the licensing report (Section 2) indicates the licensing status as Evaluation (Valid). In the case of valid evaluation licenses, the summary section of the report (Section 1) might show the “Available” licenses as a negative number. You can ignore negative available licenses if you have valid unlimited evaluation licenses. However, if the licensing status indicates an expired evaluation license, you should remove the expired evaluation license key.

Status information for unmanaged computers

If a computer has the Centrify agent installed but is not connected to a zone, its agent type is listed as *Unmanaged* in the licensing report. This agent type is primarily for computers that use Centrify MFA for Windows login authentication.

Examples

This section contains examples of a hypothetical licensing report. The examples shown here are for Enterprise Edition of Server Suite. For Standard Edition, auditing entries (DirectAudit licenses and computers) would not be included.

Example 1: Agent, license type and count

The following example shows the first portion of report Section 1, containing summary system information. Colored lines indicate how entries in each section relate to each other. Different line colors are for readability only.

Note that this example shows the agent (DirectControl, DirectAudit, and/or DirectAuthorize), the license type (UNIX, Windows, or combined UNIX and Windows), licenses found, licenses used, and licenses available.

Depending on what types of Centrify licenses you have in your environment, your own licensing report could contain fewer entries than the example shown here.

Forest Name,"forest.name"

Example 4: License detail summaries

The following example shows the final portion of report Section 1. It displays a summary for access control and privilege management (DirectControl/DirectAuthorize) licenses, and a summary for auditing (DirectAudit) licenses.

The Count string in this section is especially useful to check the total number of installed licenses. Other details include license keys, serial numbers, and expiration dates.

If the Shared string displays Yes, the license key is being shared by more than one auditing installation.

At the end of Section 1 is a checksum that validates the authenticity of the report. Do not edit the checksum or any other content preceding it before sending the report to Centrify for analysis. This example shows the layout of this section rather than example data. Depending on what types of Centrify licenses you have in your environment, your own licensing report might have more or fewer entries than the layout shown here.

```
License Report for DirectControl/DirectAuthorize
Agent Type,License Key,Count,Serial Number,Expiry Date
Evaluation (Valid),XXXXXXXX-XXXXXXXX-XXXXXXX,#,None,"d MM yyyy"
UNIX Server,XXXXXXXX-XXXXXXXX-XXXXXXX,#,#####,"None"

Example 6: Counted DirectControl and DirectAuthorize computers

The following example shows the next portion of report Section 2, containing information about counted computers where DirectControl and DirectAuthorize features are used. Information includes the system name, the timestamp of the most recent Active Directory update, OS and agent versions, zone mode (see [“Zone information for managed computers” on page 40](#)), status (see [“Status information for managed and audited computers” on page 42](#)), current zone, and license type (see [“License type information for managed and audited computers” on page 40](#)).

Information about these counted computers is collected and reported in Section 1 of the report, as shown in [“Example 1: Agent, license type and count” on page 46](#) through [“Example 4: License detail summaries” on page 49](#).

This example shows the layout of this section and example data. Depending on what types of Centrify licenses you have in your environment, your own licensing report might not use all of the layout entries shown here.

System Report of Counted Usage for DirectControl/DirectAuthorize

"qNi04XTWUH","dd MMM yyyy HH:mm:ss zzz","SUSE Linux","12.0","5.3.1-369","Express",Active,"None",None
...
```

Example 7: Counted DirectAudit computers

The following example shows the next portion of report Section 2, containing information about counted computers where DirectAudit features are used. Information includes the system name, the timestamp of the most recent communication with a collector, OS and agent versions, status (see ["Status information for managed and](#)

audited computers” on page 42), license type (see “License type information for managed and audited computers” on page 40), and remarks (see “Remarks for managed and audited computers” on page 43).

Note that the remarks string for one computer states “Orphaned,” but the computer is still counted because audited computers are counted even when they are orphaned (unlike DirectControl/DirectAuthorize computers).

Information about these counted computers is collected and reported in Section 1 of the report, as shown in “Example 1: Agent, license type and count” on page 46 through “Example 4: License detail summaries” on page 49.

This example shows the layout of this section and example data. Depending on what types of Centrify licenses you have in your environment, your own licensing report might not use all of the layout entries shown here

System Report of Counted Usage for DirectAudit

```

Example 8: Uncounted computers for all license types

The following example shows the last portion of report Section 2, containing information about uncounted computers (considered “invalid usage” computers) where DirectControl, DirectAuthorize, and DirectAudit features might be deployed.

DirectControl and DirectAuthorize information includes the system name, the timestamp of the most recent Active Directory update, OS and agent versions, zone mode (see [“Zone information for managed computers” on page 40](#)), current zone, license type (see [“License type information for managed and audited computers” on page 40](#)), and remarks (see [“Remarks for managed and audited computers” on page 43](#)).

Note that the Remarks string shows that DirectControl and DirectAuthorize computers were not counted because they were inactive, had an unknown logon time, were orphaned, or were joined to the null zone.

DirectAudit information includes the system name, the timestamp of the most recent Active Directory update, OS and agent versions, license type (see [“License type information for managed and audited computers” on page 40](#)), and remarks (see [“Remarks for managed and audited computers” on page 43](#)).

Note that the Remarks string shows that DirectAudit computers were not counted because they were inactive or duplicated.

This example shows the layout of this section and example data. Depending on what types of Centrify licenses you have in your environment, your own licensing report might not use all of the layout entries shown here

Managing licenses with legacy tools

This chapter describes how to use license management tools other than the Centrify Licensing Service to update and manage Centrify license keys for servers, workstations, supported applications, and auditing.

Whenever possible, you should use the licensing service to manage licenses as described in [Chapter 3, “Managing licenses with the Licensing Service.”](#) Only use the tools described in this chapter if you need to manage licenses on a computer where the licensing service is not available.

Managing access control and privilege management licenses

You can use the Access Manager console to manage access control and privilege management licenses on computers where the licensing service is not available.

Adding license containers

When you first set up DirectManage Access, you are prompted to create a Licenses container object because you must have at least one Licenses container in the forest into which you install license keys. It is also possible to add License containers to the forest and use those additional containers to control who can use which license keys. For example, you may want to create one license container for application servers and another for workstation licenses. You can then set permissions on the container objects to prevent the workstation administrators from installing the application server license keys and the application server administrators from installing the workstation license keys in their respective containers.

To add a new license container object:

- 1 Open the Access Manager console.
- 2 In the console tree, right-click **DirectManage Access Manager**, then click **Manage Licenses**.
- 3 In the License container section, click **Add**.
- 4 Browse to select a location for the new license container, then click **Create**.
- 5 Select either container or organizational unit to indicate the type of object to create, and type a name for the new license container object and click **OK**.
- 6 Click **OK** to close the Browse for container dialog box.
- 7 When prompted to confirm the creation of the container object, click **Yes** to add the license container to Active Directory.
- 8 Click **Permissions** to assign Read License and Modify License permissions to specific users or groups. The users or groups that you give the Modify License permission to can then add license keys to the new license container.

Assigning a specific license container to a zone

If you choose to use more than one license container in the forest, you can assign a specific license container to an individual zone. This option is useful if you want to manage zones independently with each zone using its own set of license keys rather than having all zones use a common pool of licenses. If you assign a specific license container to a zone, however, only the license keys installed in that container can be used for the computers in that zone.

For example, if you create a license container object named `ajax.org/Performix Licenses`, add a license key for 10 Workstation license to that container, and assigned that container to the `Performix Division` zone, those 10 workstation licenses are available specifically for the computers you add to the `Performix Division` zone.

To assign a license container to a zone:

- 1 Open the Access Manager console.
- 2 If prompted to connect to a forest, specify a domain controller, and, if needed, the user credentials for connecting to the domain controller, then click **OK**.
- 3 In the console tree, select **Zones** to display the list of zones.
- 4 Select a zone and right-click, then click **Properties**.
- 5 On the General tab, select a specific Licenses container from the list of available **License containers** for the zone to use, then click **OK**.

Adding license keys

To add access control and privilege management licenses:

- 1 Open Access Manager.
- 2 In the console tree, right-click **DirectManage Access Manager**, then click **Manage Licenses**.
- 3 Select the appropriate License container from the list of available license containers.

Alternatively, you can click Add to add a new license container to the Active Directory forest.
- 4 In the License keys section, click **Add**.
- 5 Type or paste the new license key string, then click **OK**.
- 6 Click **OK**.
- 7 If the Centrify Licensing Service is installed, manually refresh the license count through the Licensing Service control panel as described in [“Refreshing the license count manually” on page 20](#).

If the licensing service is installed and you do not perform this step, license additions or removals that you perform through Access Manager are not implemented until a regularly scheduled license update task executes.

Removing license keys

To remove a license key that you previously installed:

- 1 Open Access Manager console.
- 2 In the console tree, right-click **DirectManage Access Manager**, then click **Manage Licenses**.
- 3 Select the license key you want to remove, click **Remove**, then click **OK**.
- 4 If the Centrify Licensing Service is installed, manually refresh the license count through the Licensing Service control panel as described in [“Refreshing the license count manually”](#) on page 20.

If the licensing service is installed and you do not perform this step, license additions or removals that you perform through Access Manager are not implemented until a regularly scheduled license update task executes.

Managing auditing licenses

When you create an audit installation, you must provide at least one license key. Each audit installation maintains separate licensing information. You can add license keys at any time by updating the properties for an installation. All licenses are FIPS-compliant.

Adding license keys

To add license keys for auditing:

- 1 Open the Audit Manager.
- 2 Select the installation name, right-click, then select **Properties**.
- 3 On the General tab, click **Details**.
- 4 Click **Add** to add a license key.
- 5 Type the new license key, then click **OK**.
- 6 If the Centrify Licensing Service is installed, perform these steps:

- a Manually restart the Audit Management Service service.
- b Manually refresh the license count through the Licensing Service control panel as described in “[Refreshing the license count manually](#)” on page 20.

Depending on your environment, it might be necessary to wait some amount of time between Step A and Step B because the Audit Management Service could take some time to upload the license usage information to Active Directory.

If the licensing service is installed and you do not perform these steps, license additions or removals that you perform through Audit Manager are not implemented until a regularly scheduled license update task executes.

The new license will appear in the Update area of the Licenses dialog box.
